

CODDINGTON COVE RUBBLE FILL AREA

Fact Sheet Update (September 2004)

INTRODUCTION

The Coddington Cove Rubble Fill Area (Study Area 04) was included in the Installation Restoration (IR) Program in 1992.

BACKGROUND

Study Area 04 is a small area (less than 8 acres) that was used from 1978 through 1982 for general fill. Records researched for the Initial Assessment Study (IAS) indicated that the area was used for the disposal of rubble, concrete, asphalt, slate, wood, brush, and possibly small quantities of ash.

This area is located between Coddington Highway to the south and east and a railroad track running parallel to Defense Highway to the west. The site is completely vegetated and ranges from grass to thornscrub to light wooded vegetation. A stream and associated wetland also is present in this area, taking storm water drainage from uphill to the north and east.

There is no historic environmental data available for the site, and there is currently no activity there. The area is fenced and unoccupied.

RECENT ACTIVITIES

Historically the site has been regarded as a low priority for the IR Program. However, in May 2004 soil and groundwater samples were collected from wetland areas and from test pits excavated on the site to assure the appropriateness of this status. Data has been analyzed and results will be reported in late 2004.

NEXT STEPS

Based on the findings of the field investigation, this site will remain a low priority. After reports are evaluated by regulatory agencies, the future status of the Coddington Cove Rubble Fill Area in the IR Program will be determined.
